

# Is Ledger a hot wallet or cold wallet? {Ledger Is A Cold Wallet}

Ledger is primarily known as a cold wallet. It is a hardware wallet designed to store cryptocurrencies offline, providing a secure environment for private keys. Unlike hot wallets, which are connected to the internet and thus more vulnerable to hacking, Ledger devices offer enhanced security by keeping the private keys offline. This makes Ledger an ideal choice for long-term storage of digital assets. Users can manage their crypto through the Ledger Live software without compromising the security of their keys. By utilizing a Ledger wallet, users benefit from both security and convenience in managing their cryptocurrencies.
