What Is Adderall and How Does It Work?

Adderall is a prescription medication that combines amphetamine and dextroamphetamine, its generic name. It's a central nervous system stimulant used to treat Attention-Deficit Hyperactivity Disorder (ADHD) and narcolepsy.

By influencing neurotransmitters like dopamine and norepinephrine, Adderall enhances concentration, focus, and alertness — helping individuals maintain attention and reduce impulsivity.

When prescribed correctly, Adderall can make an extraordinary difference in everyday life, supporting sharper cognitive performance and emotional balance.
