long-acting opioid medication . It is specifically designed for individuals who require continuous, long-term management of severe pain that cannot be effectively controlled with other medications like non-opioids or immediate-release painkillers .

It is important to understand that Oxycontin is not intended for sporadic, "as-needed" pain relief or for post-surgical pain in opioid-naive patients . Instead, it releases medication steadily over 12 hours, providing a consistent foundation of pain control that allows patients to engage in daily activities with fewer interruptions . For those living with chronic conditions such as severe arthritis, back injuries, or cancer-related pain, this consistent relief can be life-changing .

- Dosage and Administration: Always swallow the tablets whole. Never chew, break, crush, or dissolve them, as this can lead to a dangerous overdose .
- Avoid Interactions: It is critical to avoid alcohol and sedating medications (like benzodiazepines) while taking Oxycontin, as these combinations can increase the risk of fatal respiratory depression .
- Recognize Side Effects: Common side effects include constipation (affecting about 23% of users), nausea, drowsiness, and dizziness . More serious signs include slow heartbeat, extreme sleepiness, and cold or clammy skin. If you or a loved one experiences these, seek emergency medical help immediately and use naloxone (Narcan) if available .
